

Micfil Technology System

Every day we talk and hear about the damage we are causing to the biosphere and wait for someone to make it better. We, as yacht crew, can change our behaviour to the environment and start the change on our yacht.

Micfil uses an Ultra-Fine Filter with 0.5 micron and Fuel Filter system which includes a magnetic system on the injectors and fuel lines. This system improves lubrication with less – much less – wear and without oil changes. Additionally it gives you less fuel consumption and much less smoke through clean and magnetized fuel. Overall the running costs are lower, the engine healthier and it doubles the operation time. The Micfil Technology is a known system on river ships in Germany. It is also used in companies with larger fleets of trucks and in the mining industry. Test results have shown lower running costs, healthier engines and much lower emissions.

Lets summaries the effects of the Micfil Technology System

- Solid contaminants below one micron are removed
- Up to 20 times finer than standard filters
- Engine life by reducing wear increased
- Better engine performance due to less friction
- About 5% less fuel consumption
- Eliminates routine oil changes
- Less maintenance and repair costs
- Active protection of environment by considerably less oil consumption and oil disposal
- Does not void engine warranty
- Easy to install
